Table 5: Estimation results of heterogeneity analysis
with respect to worker-type status

	Second Stage	
	blue collar	white collar
Change in share of immigrants	-0.7210***	-0.0934
	(0.2542)	(0.2033)
Dummy	-0.3388	0.3830
	(0.2195)	(0.2556)
Interaction term	0.6599*	-0.8042**
	(0.3386)	(0.3765)

NOTES:

The dependent variable is 'Changes in Preferences for Redistribution'. The columns show the second stage estimation results for 2SLS regressions with the specified dummy for worker-type status, respectively. Other variables used in the regression are omitted in this table.

Standard errors clustered on municipality level are shown in parentheses.

*   significant at the 10 percent level
**   significant at the 5 percent level
***   significant at the 1 percent level.
